

SAG 440 ASHRAE Dust Disperser

### Introduction

The SAG 440 ASHRAE dust disperser has been especially developed to meet the requirements as defined by the ASHRAE 52.2 and DIN EN 779 standards for testing the performance of particulate air filters. Due to the particular physical properties of ASHRAE test dust it was necessary to adapt the instrument to this material. The SAG 440 is particularly suited for dosing dusts containing a certain proportion of fibres and provides excellent results when producing test dust to check separation efficiencies.

### Operating principle

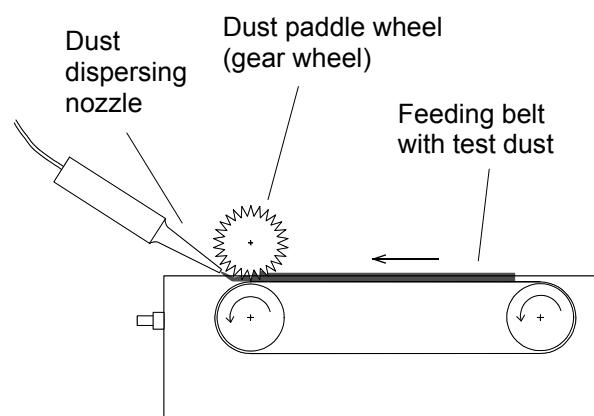

To generate a test aerosol a defined amount of test dust is put on the feeding belt, the dosing wheel adds a set quantity to the dust uptake nozzle from where it is forwarded pneumatically to the test duct. To avoid electrostatic effects it is possible to neutralise the particles with a neutraliser, e.g. Topas EAN 581.

### Special Advantages

- Constant and reproducible dosing rate over a wide concentration range makes it suitable for several applications
- Continuous operation
- Refillable during operation – ideal for long term tests
- Optional remote control unit for manual or computer control

### Applications

- Aerosol preparation for the determination of the filter dust holding capacity according to EN 779, ASHRAE 52.2
- Ideal for testing the separation efficiencies of filters
- Evaluation and calibration of dust samplers and monitors

## Specification

### Design

The dust paddle wheel and the dust dispersing nozzle are laid out in accordance with the EN 779 and ASHRAE standards. The concentration of the test aerosol can be varied by adjusting the speed of the belt and dust paddle wheel.

The compressed air supply must provide clean, dry and oil-free air.

### Electrostatic Aerosol Neutralizer

A common problem to dry dispersion aerosols is the build-up of electrical charges on particles as they touch the surface in the generator.

This problem can be resolved by passing the aerosol through a chamber containing a bipolar ion source (corona discharger). The Topas EAN 581 neutraliser applies this principle and can be ordered separately.

### Specification

|                           |   |
|---------------------------|---|
| Type of dust              | – ASHRAE 52.2 test dust<br>72% SAE fine<br>23% powdered carbon<br>5% cotton linters<br>– Other fibre-containing dusts<br>(e.g. DMT-dust type 8) |
| Dosing range              | 4...350 g/h   |
| Dosing channel (W x H)    | 114.5 x 20 mm   |
| Compressed air supply     | 7 m <sup>3</sup> /h (5 bar), max. 6 bar   |
| Power supply              | 100...240 V AC, 50-60 Hz  |
| Size of the uptake nozzle | 1150 x 290 x 400 mm   |
| Size of the Control Unit  | 300 x 130 x 185 mm  |
| Weight                    | 33.5 kg   |

QMS certified to  
DIN EN ISO 9001.
